

CHAPTER 7

THE GLOBAL CLIMATE SYSTEM

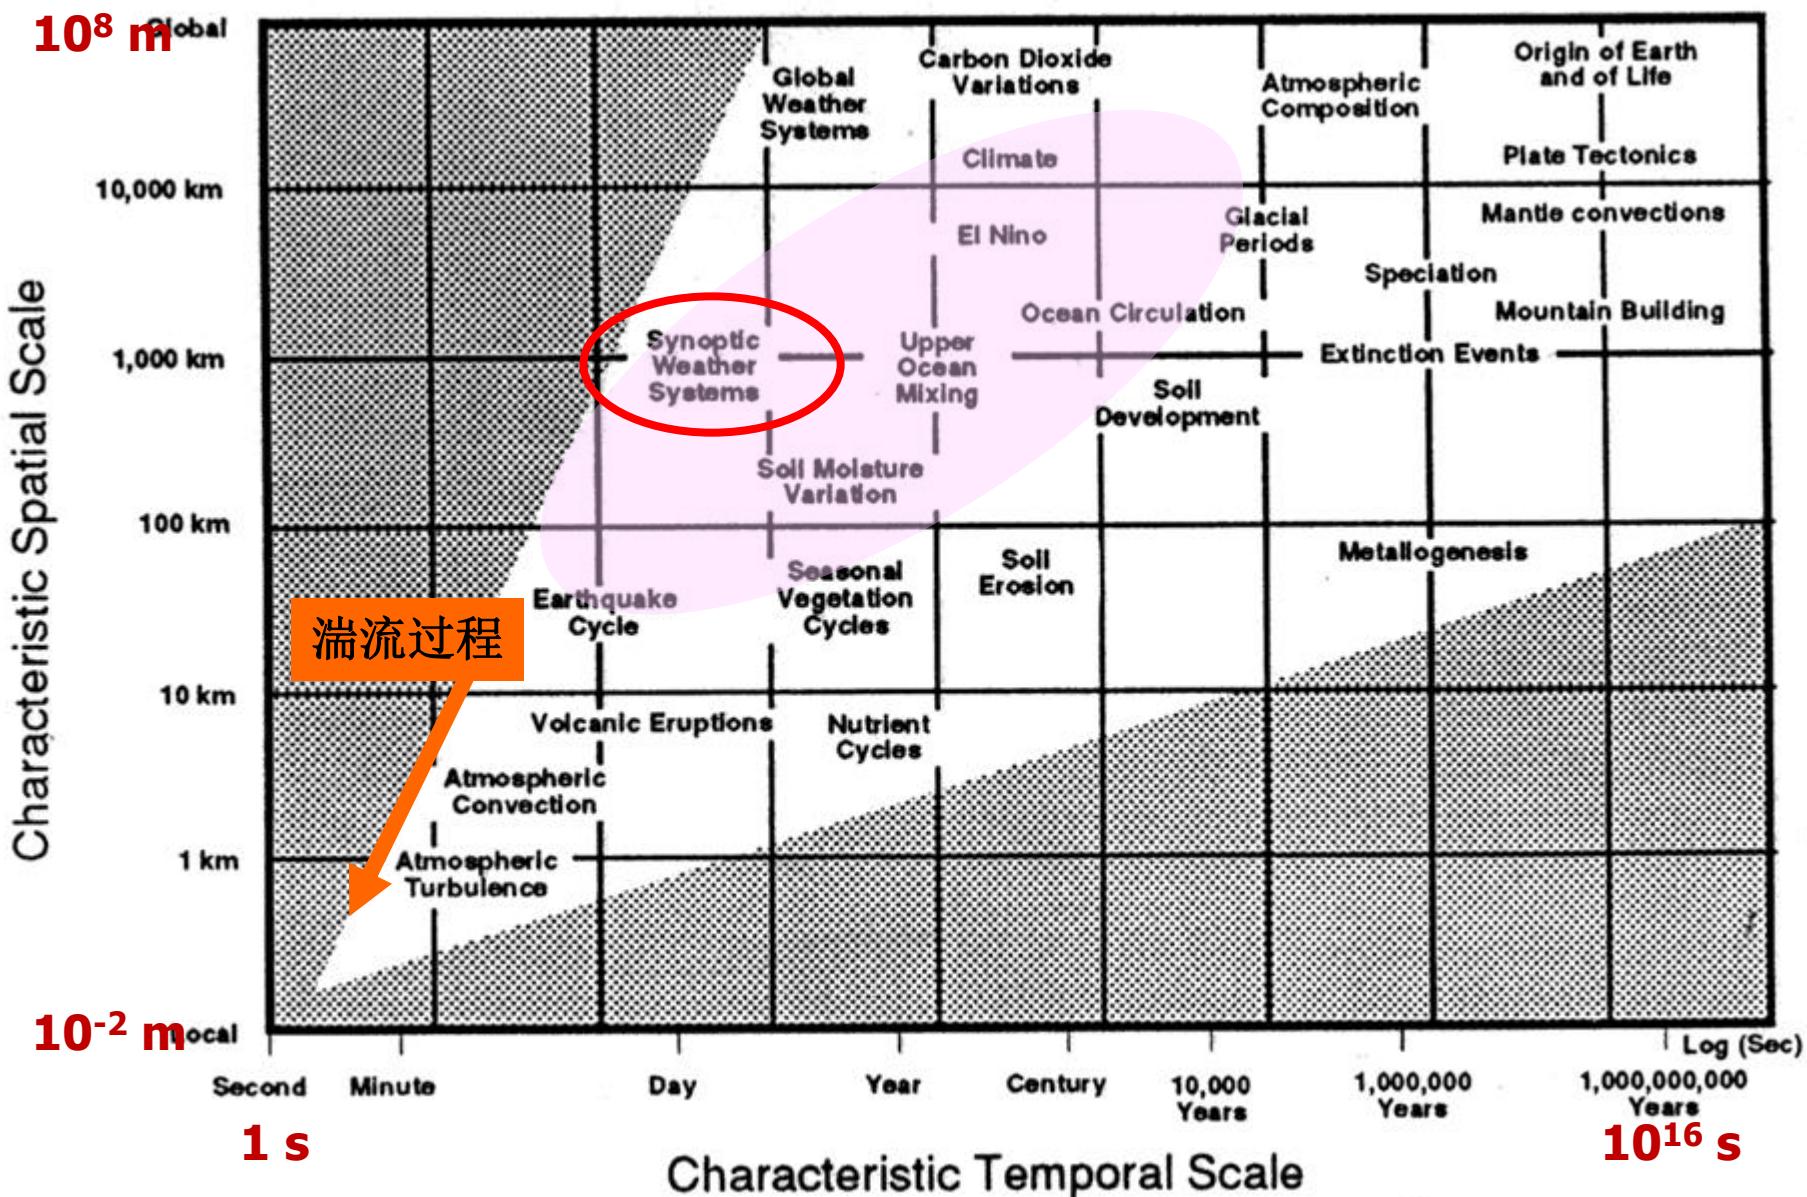

气候

- 气候系统：一个复杂的、各部分相互作用的系统，包括大气、陆地表面、冰雪、海洋和其它水体以及生物
- 传统/狭义上，气候通常被描述为从数月到数百万年的一段时间内（通常采用30年的时间段）的气温、降水、风等气象变量的平均值及变率

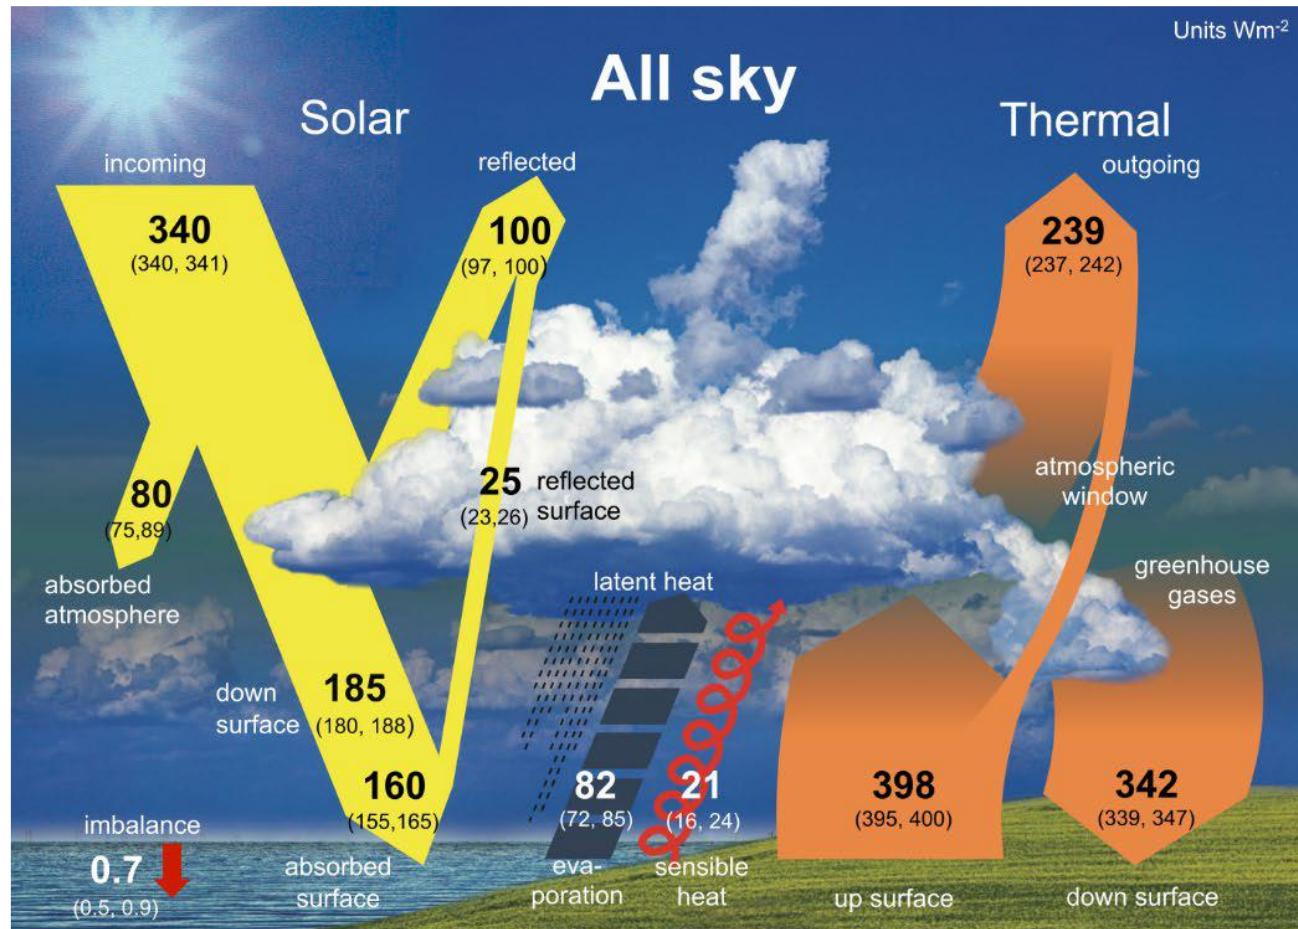

我们最关心的问题：气候系统的变化、原因机制（自然强迫、内部变率、人类活动）、对相关自然和人文环境的影响、以及未来气候变化和应对

Spatiotemporal Scales in the Earth Climate System

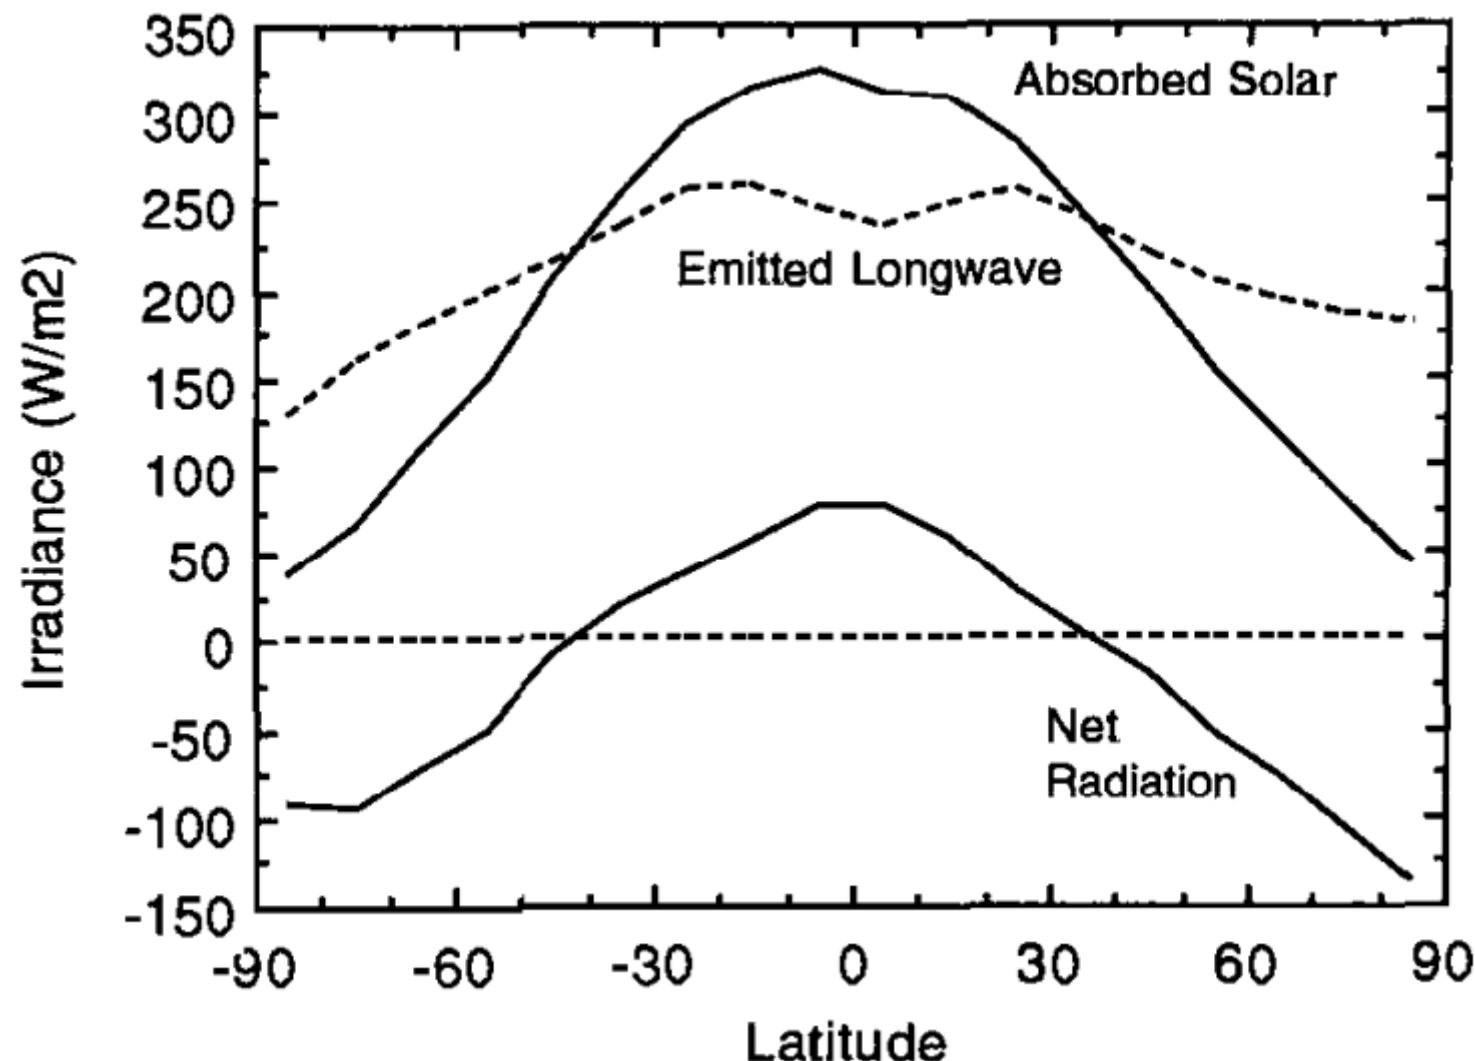

Earth Energy Budget

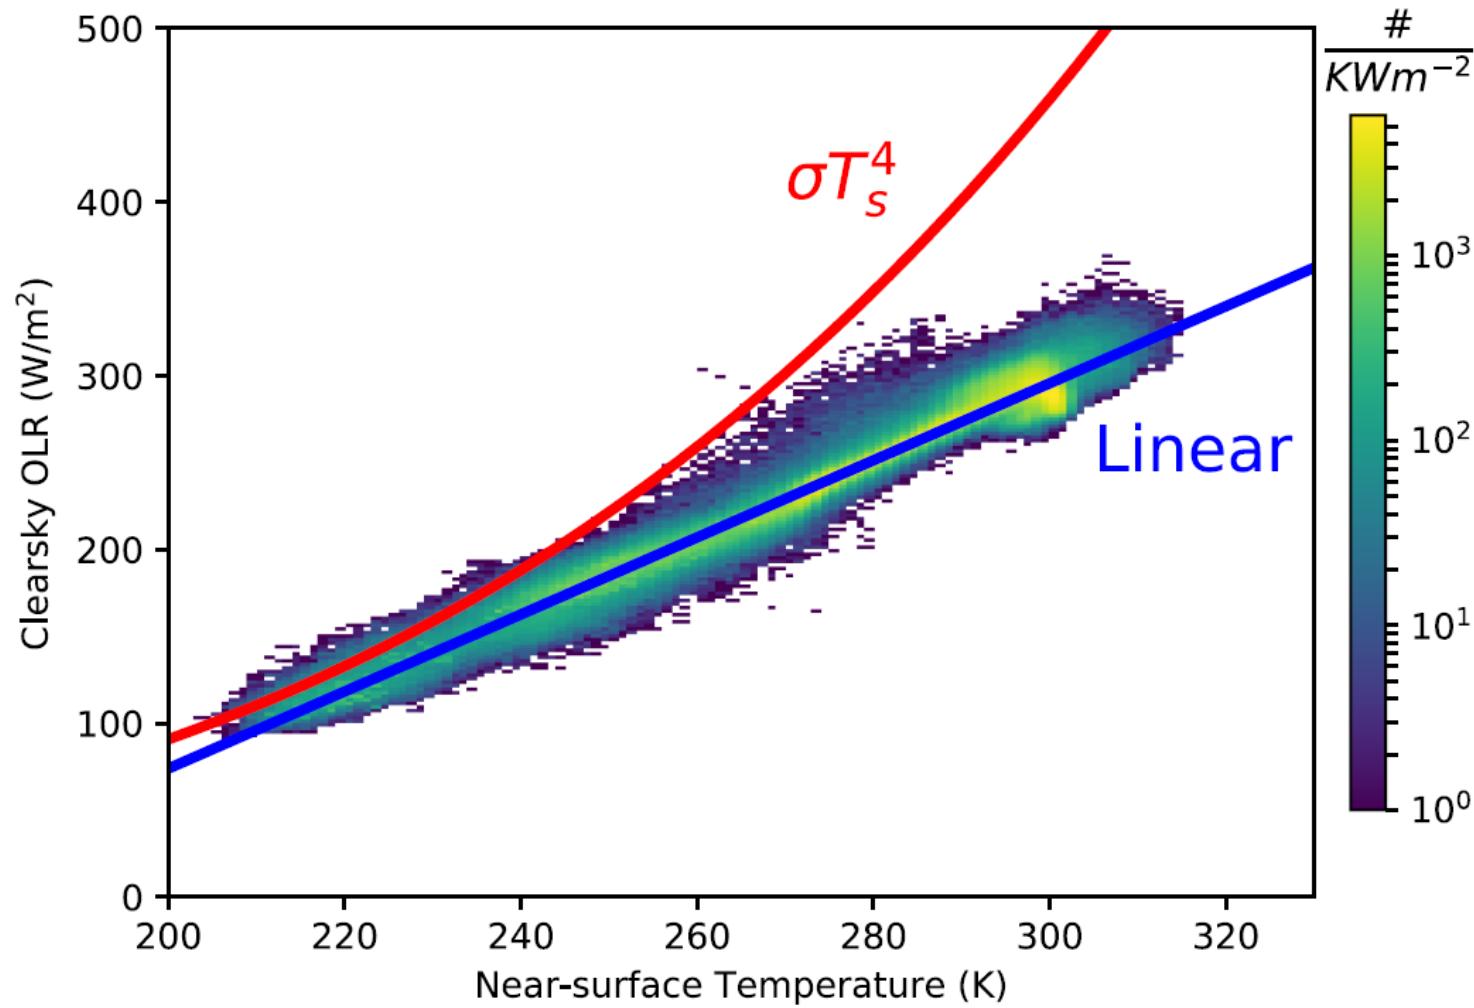

IPCC, 2021

- Energy balance: Atmosphere $80 + (398 - 40) + 21 + 82 - 342 - (239 - 40)$, Surface $160 + 342 - 398 - 21 - 82$, Earth TOA $340 - 100 - 239$
- Planetary albedo: $\sim 29\%$ (surface 7%, atmosphere 22%)

COLD EPISODE RELATIONSHIPS DECEMBER - FEBRUARY

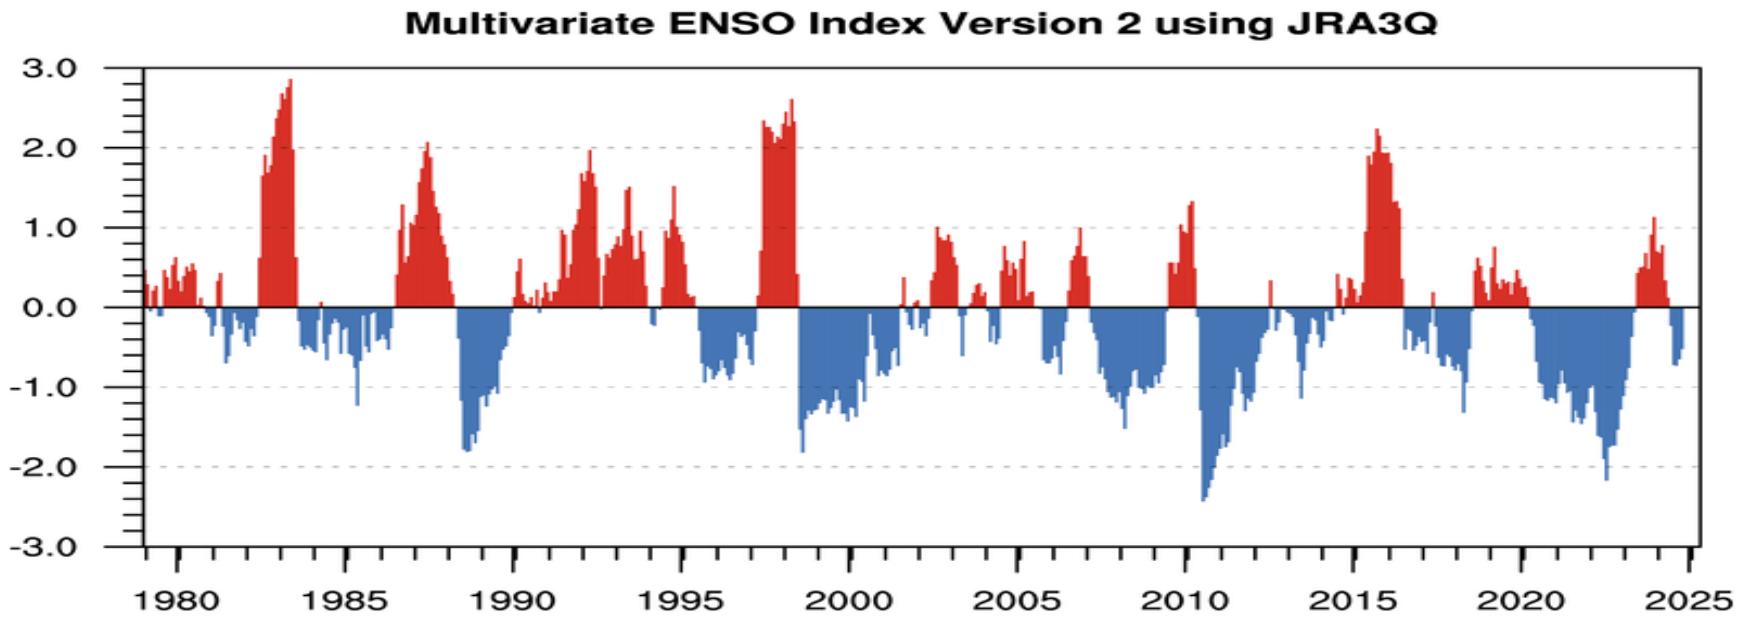

WARM EPISODE RELATIONSHIPS JUNE - AUGUST

COLD EPISODE RELATIONSHIPS JUNE - AUGUST

ENSO Index: MEI (NOAA)

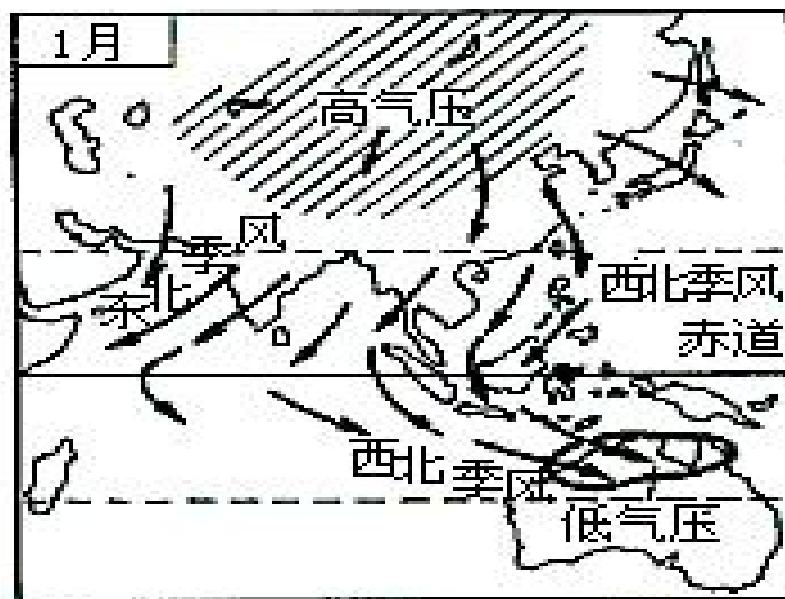

- Index: Positive for El Niño and negative for La Niña
- Data: the time series of the leading combined Empirical Orthogonal Function (EOF) of five different variables (sea level pressure (SLP), sea surface temperature (SST), zonal and meridional components of the surface wind, and outgoing longwave radiation (OLR)) over the tropical Pacific basin (30S-30N and 100E-70W)
- Procedure: Sliding bi-monthly, normalization, standardization, co-variance matrix, 1st PC
- Details: <https://psl.noaa.gov/enso/mei/>

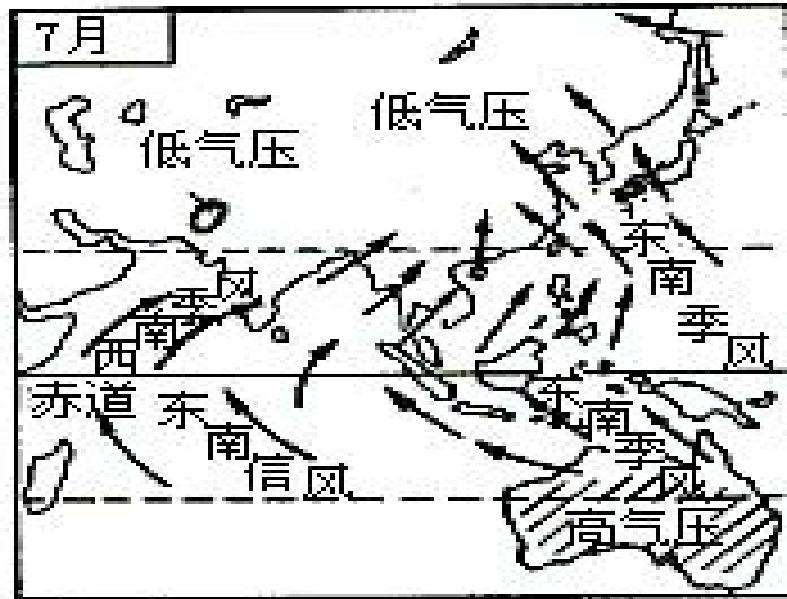

Monsoon

Play movie

季风

冬季风

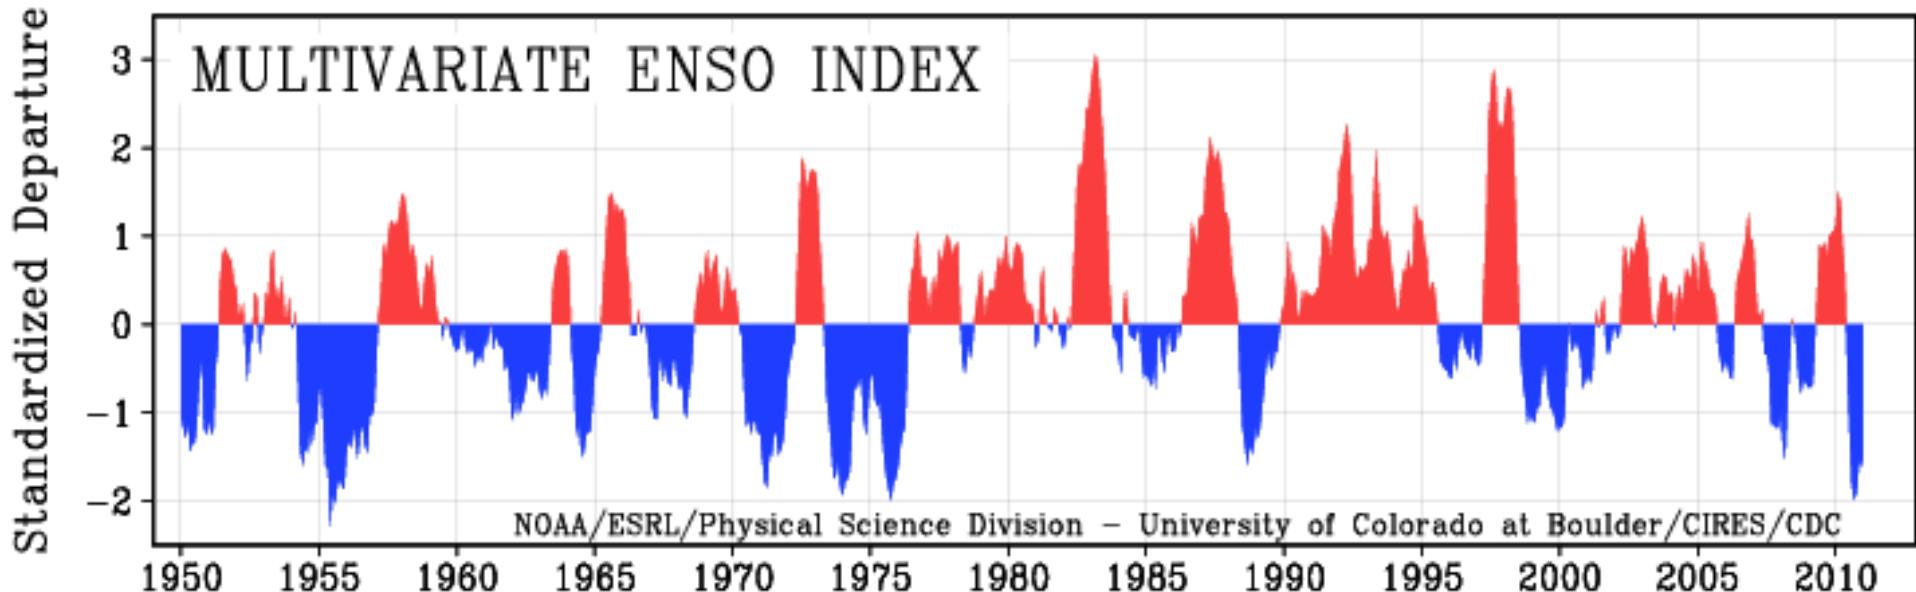

夏季风

亚洲1月、7月的季风图

- ✓ 季风是由于大陆和海洋在一年之中增热和冷却程度不同，在大陆和海洋之间大范围的、风向随季节有规律改变的风。
- ✓ 季风伴随着降水变化，是大气环流的重要组成部分。
- ✓ 季风由海陆热力学差异（即温差）引起，可视为大尺度的‘海陆风’。
- ✓ 东亚季风是我国降水的重要来源，也是我国气候的主要影响因子。

东亚季风指数

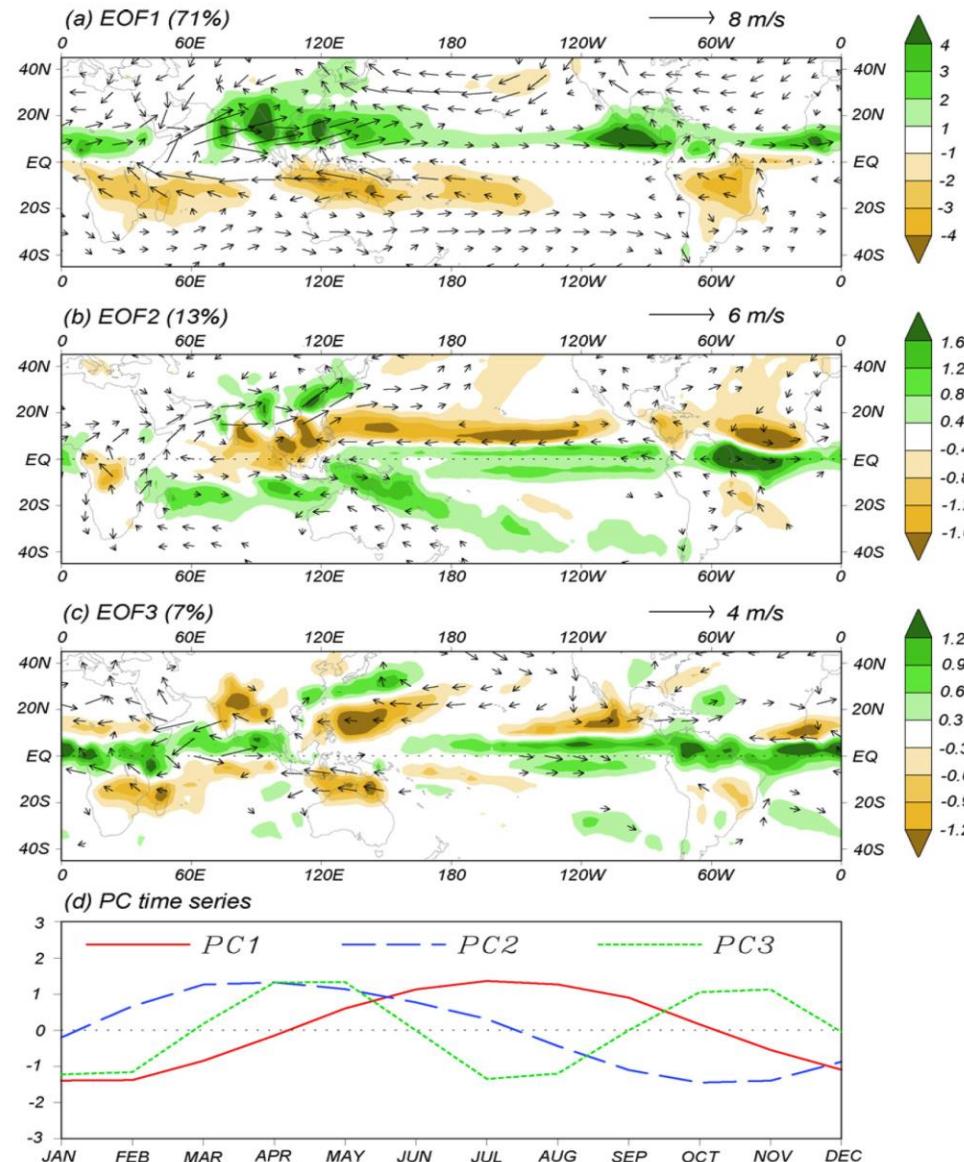

- El Niño次年夏天：东亚季风变弱，雨带长期停留在我国南方，南方洪涝，北方干旱
- La Niña：相反。

东亚夏季风强度指数(3)变化
Variation of East Asian summer monsoon index (3)

Global Monsoon

Quiz

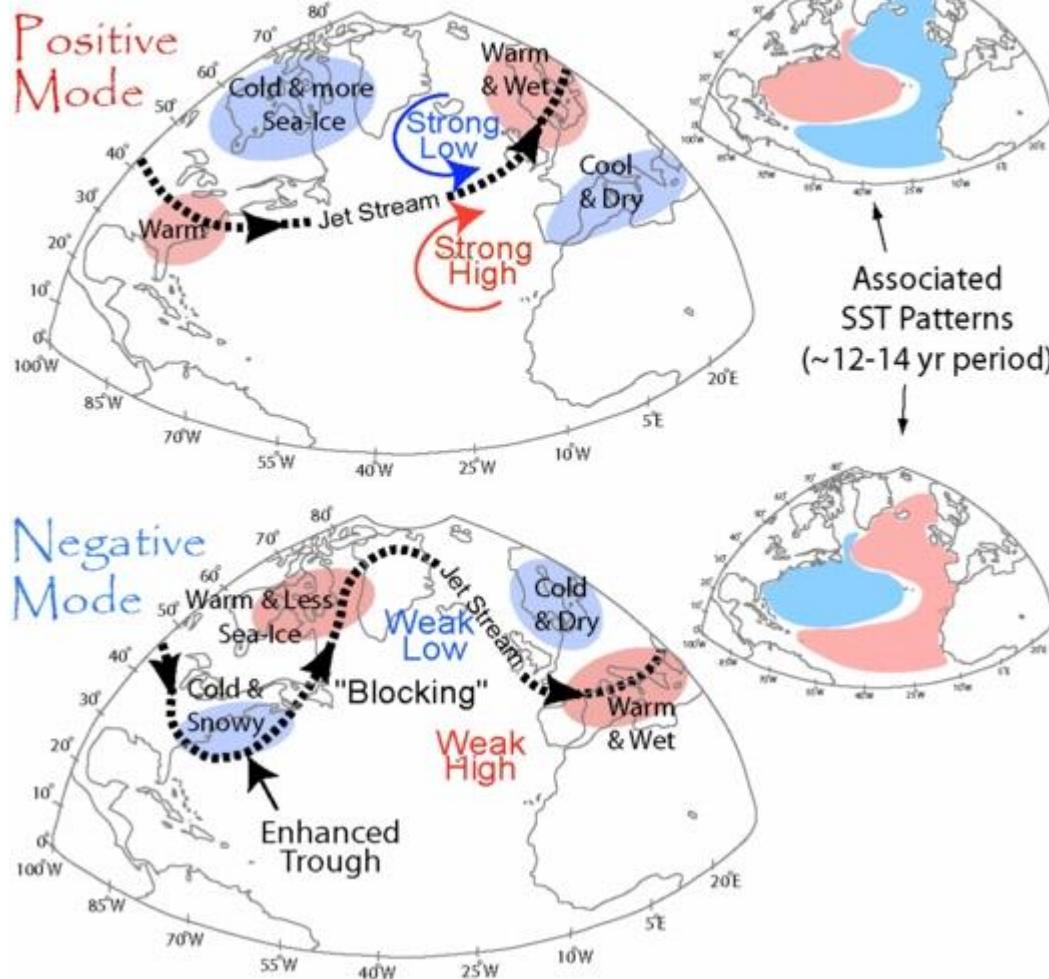

- 1. Why is cloud top higher in summer than in winter over East China?**
- 2. Why is there subsidence in the subtropics?**
- 3. Explain the circulation around the Tibetan Plateau**
- 4. Why are the PDO and AMO changes look like T?**

Pacific Decadal Oscillation (PDO)

North Atlantic Oscillation (NAO)

North Atlantic Oscillation

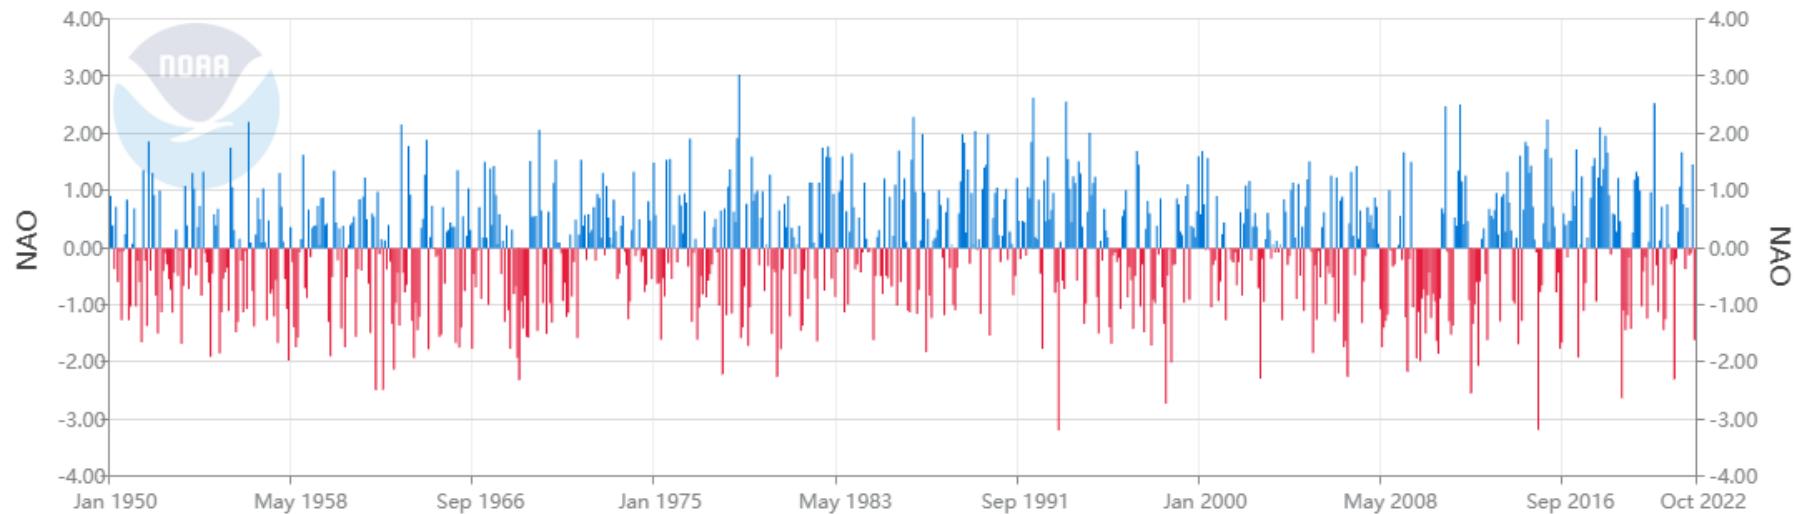

NAO: a climatic phenomenon in the North Atlantic Ocean of fluctuations in the difference of atmospheric pressure at sea level between the Icelandic low and the Azores high

NAO is one of the most important manifestations of climate fluctuations in the North Atlantic and surrounding humid climates

NAO Index

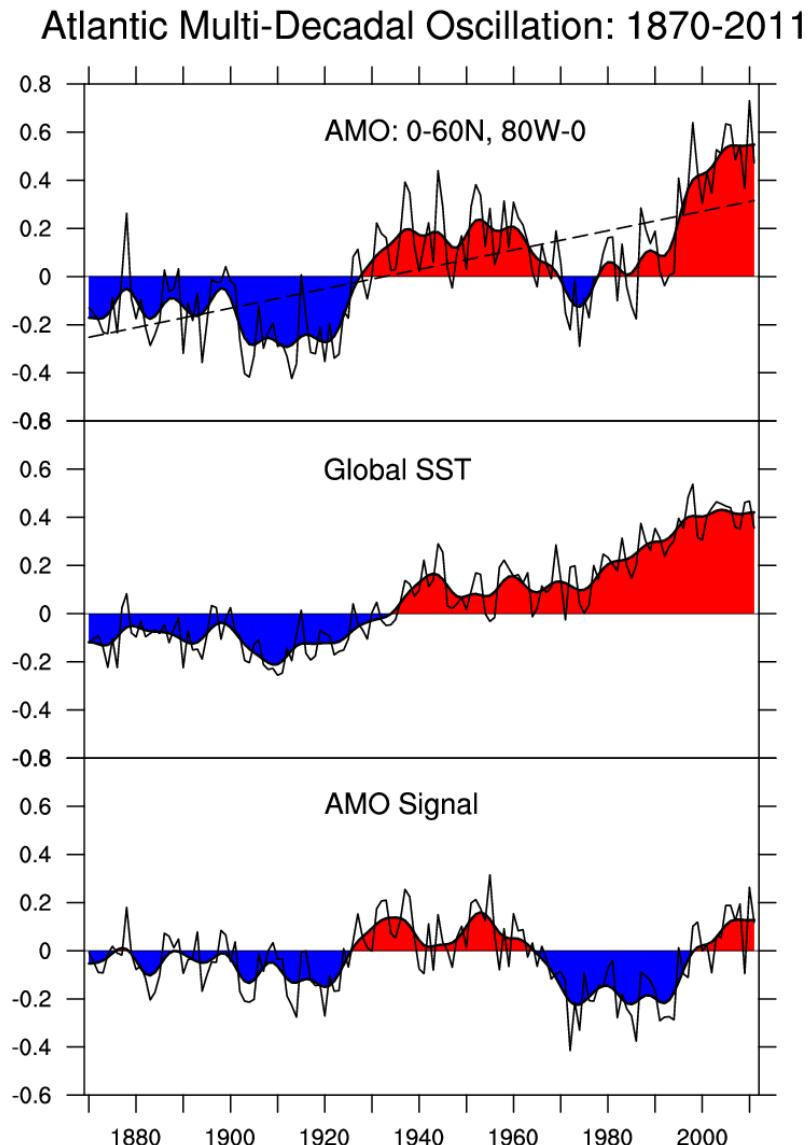

North Atlantic Oscillation (NAO)

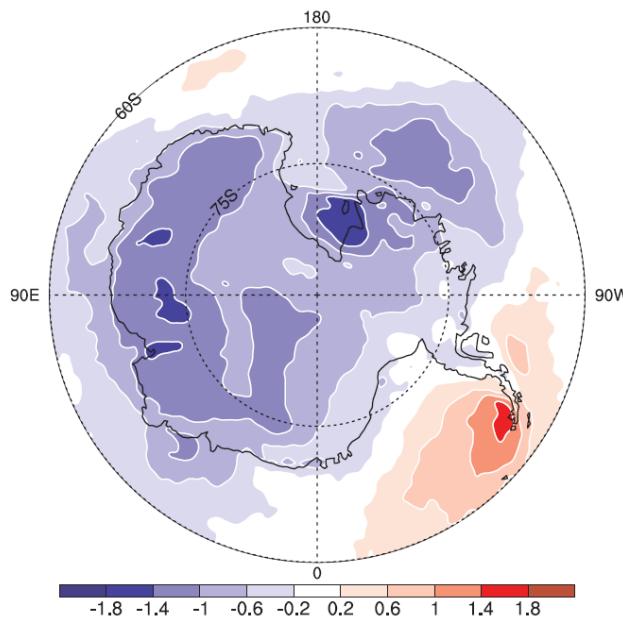

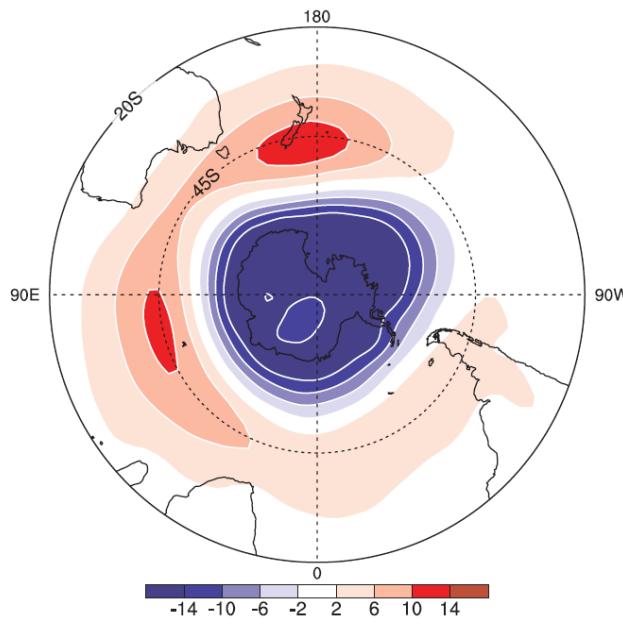

<https://www.ncdc.noaa.gov/teleconnections/nao/>

Atlantic Multi-decadal Oscillation (AMO)

AMO: Over the instrumental period (since the 1850s), North Atlantic SSTs show a 65 to 75 year variation (0.4° C range), with a warm phase during 1930 to 1960 and cool phases during 1905 to 1925 and 1970 to 1990

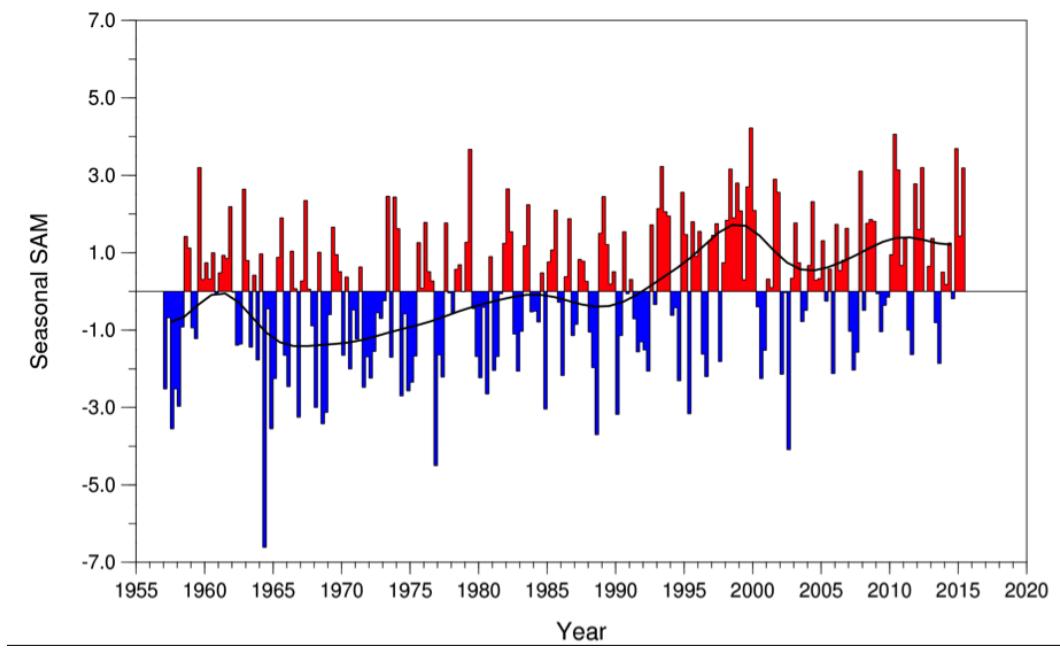

Southern Annular Mode (SAM)

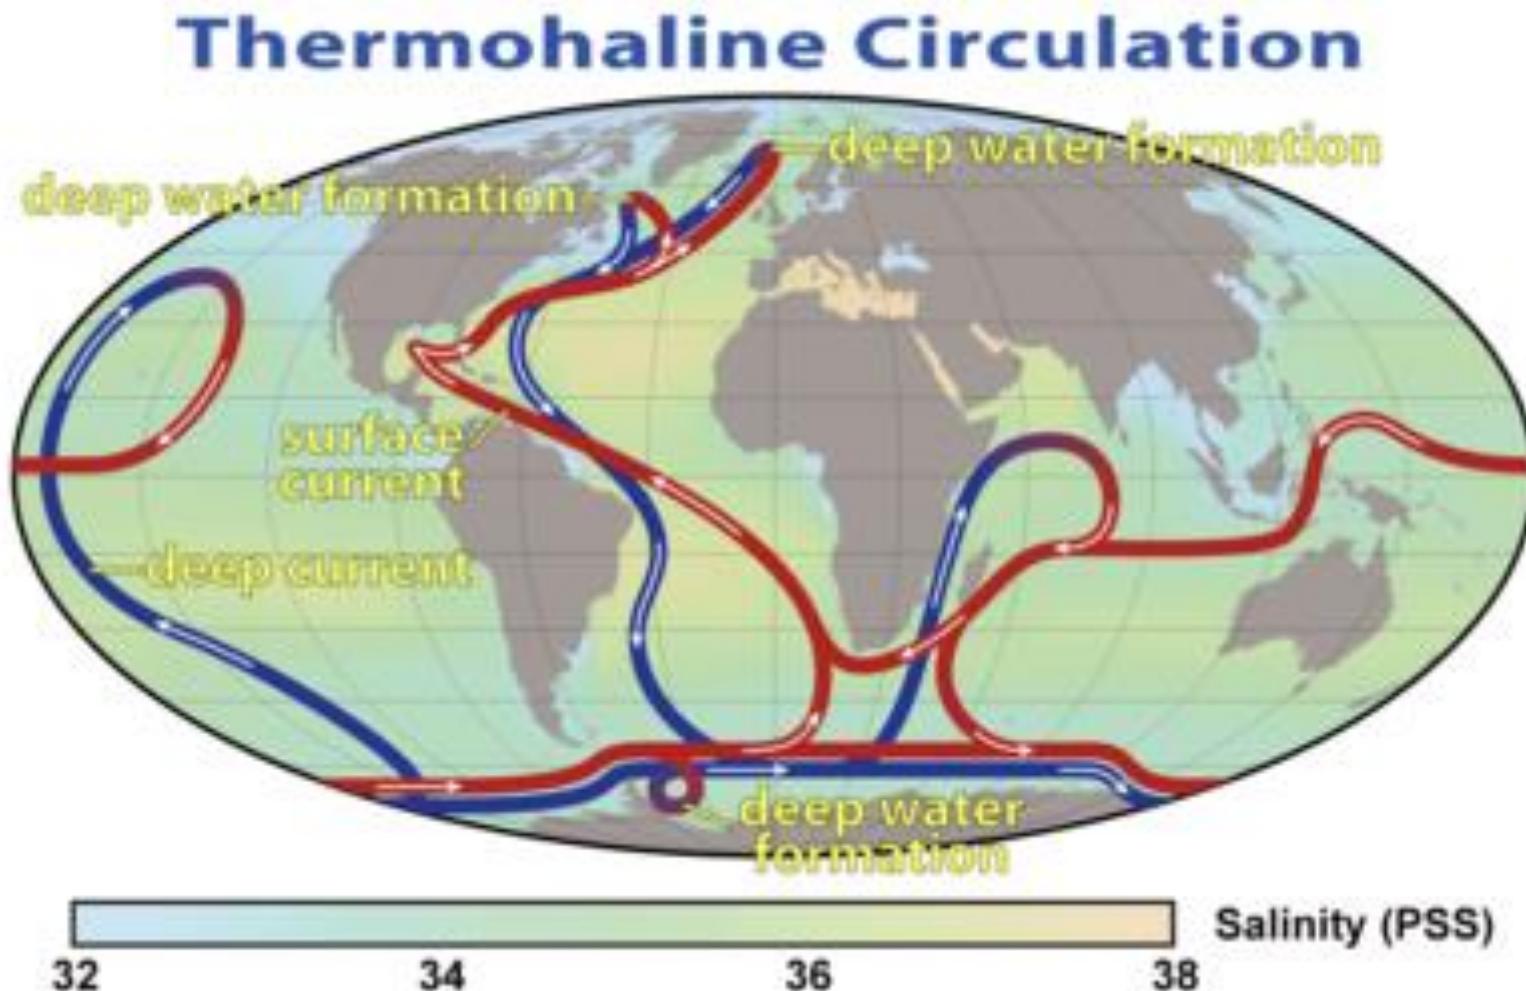

Antarctic Oscillation (AAO)

SAM index (station-based): Difference in MSLP between SH middle and high latitudes (usually 40° S and 65° S)
SAM is the principal mode of variability of the atmospheric circulation in the SH extratropics

Thermohaline Circulation, or MOC

Driver: density gradient in association with temperature and salt content
